

Immediate Graft™

Regenerating a Severe Distal Moat with the Inverted Periosteal Graft

CASE

This patient presented with a 12 mm distal probing #31. The surgical treatment utilized the Inverted Periosteal Graft.

6 weeks post op shows the lesion regenerated with a new periodontal ligament. Increased mineralization of the regenerated bone will continue over the next 5 months. (A) Base of original defect. (B) Regenerated periodontal ligament. (C) regenerated bone. The probings are within normal limits.
